

Put DetectedX inside your learning platform

Every option gives your learners the same case library and the same viewer. They differ in how much your IT team does, and in how much comes back to you automatically.

A
NO INTEGRATION
Module links

A link for each module. Paste it into a course page, an email or an intranet.

Your IT work	None
Learner sign-in	Free account, created once
Results	Stay in DetectedX
Ready	Same day
Best for	A few modules, informal use

B
NO INTEGRATION
Personal launch links

Each learner gets their own link, placed behind your login. One click signs them in.

Your IT work	None
Learner sign-in	No password
Results	Cohort report from us
Ready	Within a week
Best for	A defined cohort, no IT time

C
YOUR DEVELOPMENT
Partner API
D
STANDARDS-BASED
LTI 1.3
Recommended

Which one fits you?

Your LMS supports LTI 1.3. Moodle, Canvas, Blackboard, D2L Brightspace and most others do.

Option D

No LTI, but you have a portal or LMS with developers who can call an API.

Option C

You want a named cohort started quickly, with no password and no IT involvement.

Option B

You want a few modules available to whoever follows the link.

Option A

You can change your mind later. Many institutions start with links and move to LTI when they're ready. Learner accounts, history and CME carry across, so nobody starts again.

How Option D works

STEP 1

Register once

Your LMS administrator adds DetectedX as an external tool: three web addresses and a key. No plugin and no server access.

STEP 2

Lecturers add modules

They add a DetectedX activity and pick a module from our library, inside their own course editor.

STEP 3

Learners click, results return

Learners arrive signed in. When they finish, their results appear in your gradebook.

What comes back: one gradebook column per measure, such as sensitivity, specificity, lesion sensitivity, ROC and JAFROC, where the module measures them. Not a single mark, but the reader-performance profile that imaging education is about.

Your sign-on stays where it is

In options B, C and D, your institution signs learners in as it does today, with Microsoft 365, Entra ID, Shibboleth or local accounts. Your system then tells us who the learner is.

There is nothing for your identity team to configure, and we never see a password.

Data and access

- We receive a name, an identifier, and an email only if you release it.
- Remove someone from your course and they can no longer get in.
- Sign-in links are single use and expire within minutes.
- Records are deleted on written request.
- Learners are never added to marketing lists.

What we need from you

Option A

The modules you want, and where the links will go.

Option B

A cohort list, the modules, and a contact for joiners and leavers.

Option C

Who will build it, your group structure, and a test environment.

Option D

Your LMS and version, cloud or self-hosted, and an administrator.

Cloud-hosted or your own server, Option D sets up the same way. A self-hosted LMS must be reachable from our servers so results can come back.

How each option is charged

OPTION	CHARGED ON	SET-UP FEE
A • Module links	Per module link, per period	None
B • Launch links	Per learner or per cohort, per period	None
C • Partner API	Per learner, per period	Integration support fee
D • LTI 1.3	Per learner or per programme, per period	Registration and validation fee

Content is licensed the same way in every option: a chosen set of modules, or the full library. Prices are confirmed per institution in a written quote.

Talk to us about your platform

Tell us which LMS you use. We'll tell you which option fits, and what, if anything, your IT team needs to do.
